

*

Route 53 *

Amazon Route 53 Registrar point to EB.

Which Route 53 Record type to weig

Alias

Weighted Routing Policy allows to redirect part

- of the traffic based on weight (eg: 1%). It's a common use case to send part of traffic to a new version of your application.
- Each DNS record has a TTL (Time to Live) which orders clients for how long to cache these values and not overload the DNS Resolver with DNS requests. The TTL value should be set to strike a balance between how long the value should be cached vs how many requests should go to the DNS Resolver.
- Latency Routing Policy will evaluate the latency between your users and AWS regions, and help them get a DNS response that will minimize this latency (eg: response time).
- Public hosted zones are meant to be used for people requesting your website through the internet. Finally, NS records must be updated on the 3rd party registrar.
- Health checks cannot monitor SQS queue.
